Basis

Reinforcement learning

It is a feedback-based learning method, in which  
a learning

Bias-variance is also known as loss function.

Bias means there is a difference between the  
actual data and expected data.  
when we make some modifications on the run  
model.

Errors in machine learning

=  
Reducible errors: The errors can be reduced  
to improve the model accuracy.

En: Bias and variance.
